Database Settings
Choose how you would like to connect to the Openfire database.
Standard Database Connection
Use an external database with the built-in connection pool.
Embedded Database
Use an embedded database, powered by HSQLDB. This option requires no external database configuration and is an easy way to get up and running quickly. However, is does not offer the same level of performance as an external database.

Profile Settings
Choose the user and group system to use with the server.
Default
Store users and groups in the server database. This is the best option for simple deployments.
Directory Server (LDAP)
Integrate with a directory server such as Active Directory or OpenLDAP using the LDAP protocol. Users and groups are stored in the directory and treated as read-only.
Clearspace Integration
Integrate with an existing Clearspace installation. Users and groups will be pulled directly from Clearspace. Clearspace will also be used for authenticating users. Please be aware that Clearspace 2.0 or higher is required.

Openfire Setup: Profile Settings - Directory Server - Windows Internet Explorer
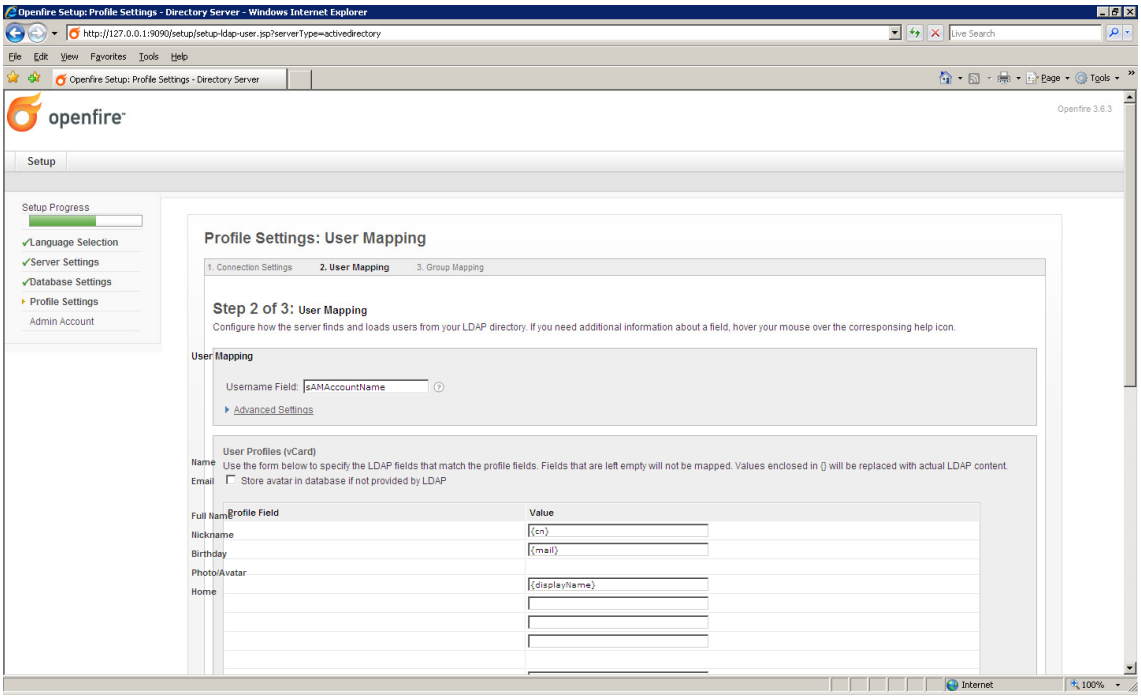
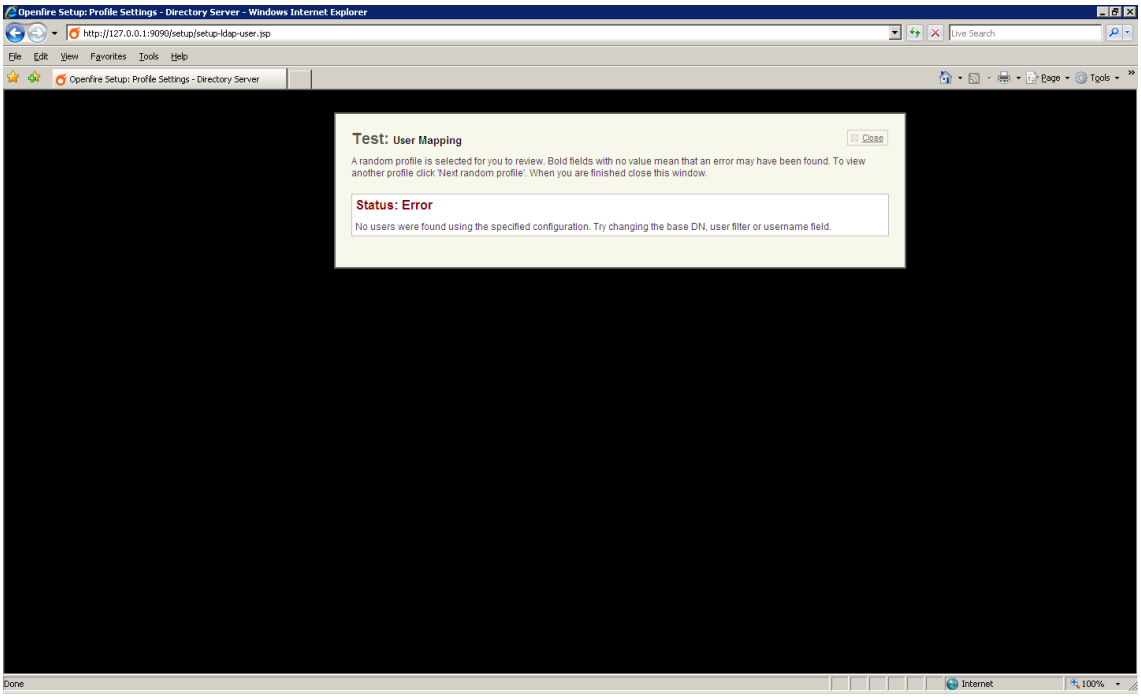
Test: Connection Settings
Close
Status: Success!
A connection was successfully established to the LDAP server using the settings above. Close this test panel and continue to the next step.

****

When I got this screen, starts to show me errors.




By the way, I did not change any value in this step (02/03 user mapping)
